

UML Diagrams for WW1 Bradford Based Website

UML diagrams are used to simply display how a system will interact with users and how the code works to clients and developers and is a clear line of communication between every individual or group involved such as clients, sales representatives and back-end developers.

UML Sequence diagram

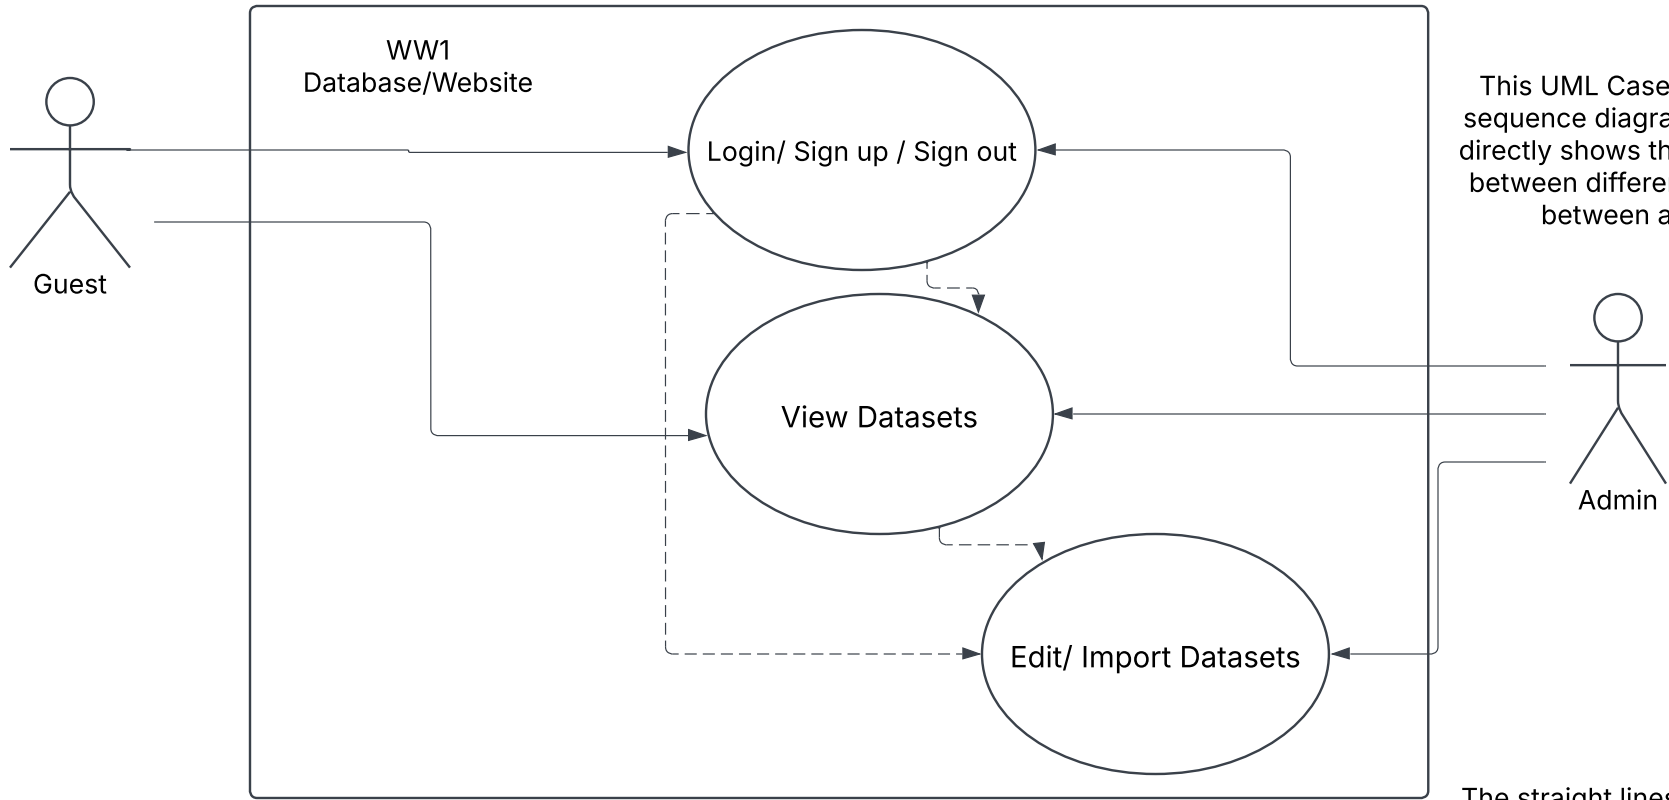

Actor 1/ user 1 represents a potential user of the website and how they could potentially use the website and the process behind the scenes.

The 'website' box represents the website itself such as the display the user sees.

The 'storage Database/server' box represents where the information is stored and each horizontal arrow indicates how the process could work.

With each request there is an alternative action which is sectioned in with the original request such as a correct password being used and an incorrect password being used.

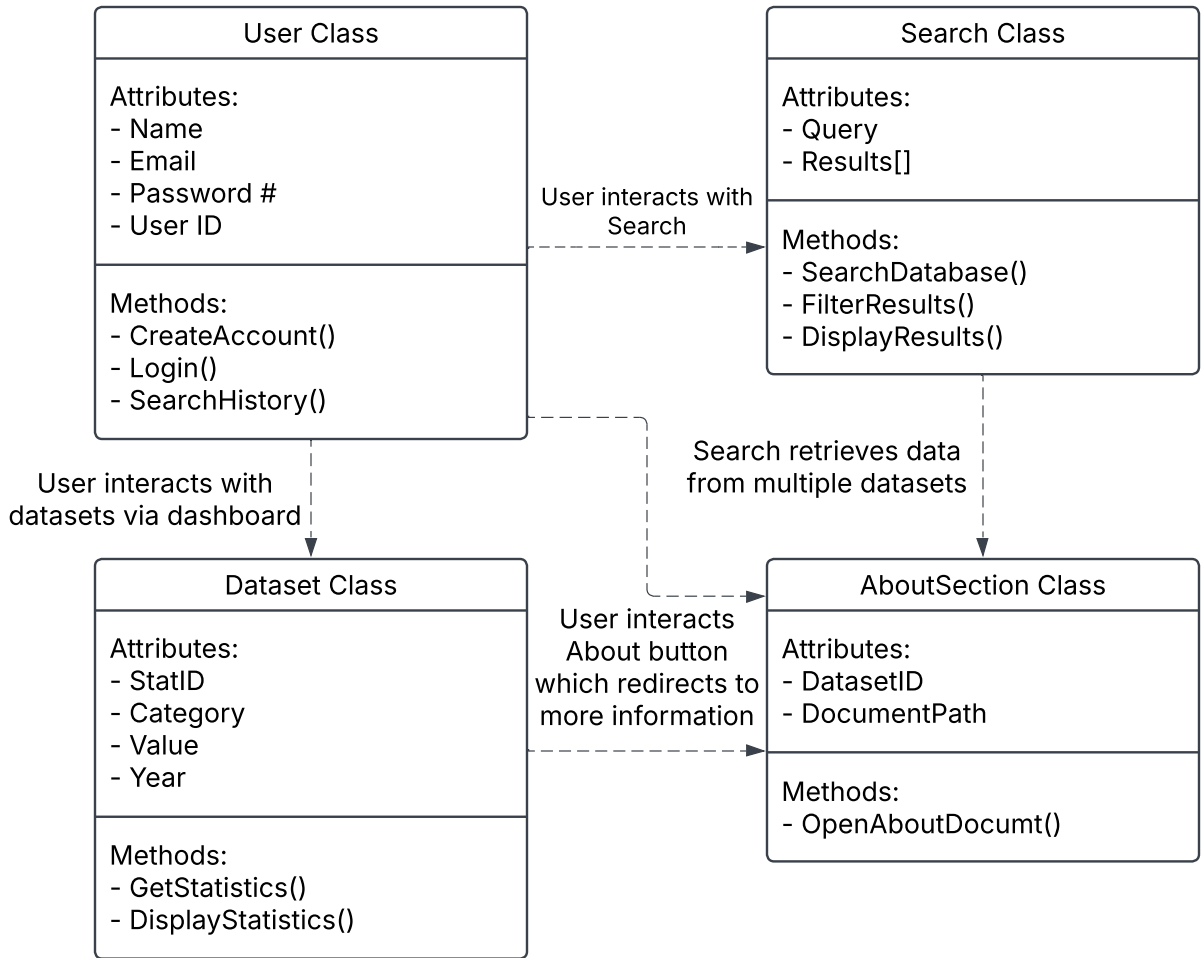

UML Case Diagram

This UML Case diagram in comparison to the sequence diagram is simpler to understand and directly shows the different options and controls between different users accessing the website between a Admin and a guest user.

The straight lines from user to action/use case represent how thw user can directly interact with the website and the dotted lines represent how each action/ use cases are linked via the code.

UML Class Diagram

Class diagrams are more complex UML diagrams which are used to show how the different classes within the code are used and how the different attributes and methods work with each other.
